La chirurgie oculomotrice est une **microchirurgie** ; elle permet d'opérer aujourd'hui les strabismes et les nystagmus avec une plus grande précision et une plus grande sécurité.

La chirurgie oculomotrice est aujourd'hui plus performante ; elle s'est développée dans quatre directions :

- la détermination de l'angle de base ou cible et des variations angulaires et la prise en compte des données peropératoires,
- les **stratégies opératoires logiques**, basées sur une meilleure compréhension des déséquilibres oculomoteurs et des effets opératoires,
- la chirurgie ambulatoire dont les conditions, en matière d'anesthésie, sont aujourd'hui bien codifiées,
- l'anesthésie topique et sous-conjonctivo-ténonienne pour certaines opérations.

La chirurgie oculomotrice est aujourd'hui plus exigeante. Son **but, avant tout fonctionnel**, est de corriger au mieux la déviation strabique afin de (r)établir, selon les potentialités binoculaires, la binocularité normale ou une binocularité angle-dépendante aussi proche que possible de la normale.

Ce traité réunit les connaissances actualisées, théoriques et pratiques de la chirurgie oculomotrice ; quintessence des enseignements dispensés par les quatre auteurs, il est l'outil indispensable autant à l'initiation des opérateurs débutants qu'au perfectionnement des opérateurs confirmés.
